Abstract: Synthesis of a proline-rich cyclic hexapeptide – diandrine A [VI] was accomplished by coupling of tetrapeptide unit Boc-Gly-Pro-Trp-Pro-OH with dipeptide unit Tyr-Phe-OMe followed by cyclization of linear peptide unit [V] under alkaline condition. Structure of newly synthesized cyclopolypeptide was elucidated by means of spectral techniques including FTIR, 1H NMR, 13C NMR, MS analyses. VI was subjected to pharmacological screening and found to exhibit good antifungal activity against dermatophytes. Further, VI possessed potent anthelmintic activity against earthworms *M. konkanensis*, *P. corethruses* and *Eudrilus sp*.

Keywords: diandrine A, cyclic hexapeptide, peptide synthesis, antifungal activity, anthelmintic activity

EXPERIMENTAL

Materials and methods

Melting point was determined by open capillary method and was uncorrected. L-Amino acids and other chemicals used were obtained from Spectrochem Limited (Mumbai, India). IR spectra were recorded on Shimadzu 8700 FTIR spectrophotometer (Shimadzu, Japan) and 1H and 13C NMR spectra were recorded on Bruker AC NMR spectrometer (Bruker, USA) at 300 MHz. FAB-MS was recorded on JMS-DX 303 Mass spectrometer (Jeol, Tokyo, Japan) operating at 70 eV. Elemental analyses were performed on Vario EL III elemental analyzer (Elementar, Germany) and optical rotation was measured on automatic polarimeter (Optics Tech, Ghaziabad, India) in a 2 dm tube at 25°C using methanol as solvent. Purity of all compounds was checked by TLC on precoated silica gel G plates using mixture of chloroform and methanol in different ratios (9 : 1 intermediate linear peptides and 7 : 3 for cyclopeptide).

Abbreviations: str – stretching, bend – bending (deformation), oop – out-of-plane, s – strong, m – medium, w – weak, m/br – medium/broad (FT-IR spectra); s – singlet, d – doublet, t – triplet, m – multiplet, br. s – broad singlet, dd – doublet overlapped over doublet (NMR spectra)

General method for the synthesis of dipeptide fragments I-III

Triethylamine (TEA, 2.8 mL, 0.021 M) was added to amino acid methyl ester hydrochloride (0.01 M) previously suspended in chloroform (20 mL) at 0°C and resulting reaction mixture was stirred for 15 min. To this, another mixture of Boc-amino acid (0.01 M) in chloroform (20 mL) and N,N-diisopropylcarbodiimide (DIPC) (1.26 g, 0.01 M) was added with stirring. After 24 h, the final reaction mixture was filtered and the filtrate was washed with 5% NaHCO3 and saturated NaCl solutions. The organic layer was dried over anhydrous Na2SO4, filtered and evaporated in vacuum. The crude product was recrystallized from a mixture of chloroform and petroleum ether.

Synthesis of cyclic hexapeptide, diandrine A [VI]

To synthesize compound VI, linear hexapeptide unit V (0.005 M) was deprotected at carboxyl end using LiOH (0.18 g, 0.0075 M) in THF: H2O (1:1) to get Boc-Gly-Pro-Trp-Pro-Tyr-Phe-OH. The deprotected hexapeptide unit (0.005 M) was now dissolved in CHCl3 (50 mL) at 0°C. To the above solution, pentafluorophenol (1.23 g, 0.0067 M) and DIPEA (0.63 g, 0.005 M) was added and stirred at room temp. for 12 h. The reaction mixture was filtered and the filtrate was washed with 10% NaHCO3 solution (2 x 25 mL) and 5% HCl solution (3 x 25 mL) to get the corresponding pentafluorophenyl ester Boc-Gly-Pro-Trp-Pro-Tyr-Phe-O-pfp. To this compound (0.004 M) dissolved in chloroform (25 mL), trifluoroacetic acid (0.91 g, 0.008 M) was added, stirred at room temp. for 1 h and washed with 10% NaHCO3 solution (3 x 20 mL). The organic layer was dried over anhydrous Na2SO4 to get Boc-Gly-Pro-Trp-Pro-Tyr-Phe-OH. The deprotected hexapeptide unit (0.005 M) was now dissolved in CHCl3 (50 mL) at 0 OC. To the above solution, DIPC (0.63 g, 0.005 M) was added and stirred at room temp. for 1 h and washed with 10% NaHCO3 and 5% HCl solutions (3 x 15 mL) to get Gly-Pro-Trp-Pro-Tyr-Phe-OH. The reaction mixture was washed with 10% NaHCO3 and 5% HCl solutions (3 x 25 mL). The organic layer was dried over anhydrous Na2SO4. Finally, chloroform was distilled off and crude cyclized product was crystallized from CHCl3/n-hexane to get pure cyclo (glycyl-prolyl-tryptophanyl-prolyl-tyrosinyl-phenylalanyl) [VI].

Yellowish needles, m.p. 135-137°C. Yield 79.8% (NMM), 70.3% (TEA), 66.8% (CH3N), [α]25Sp = -67.8° (c 66.8°, CH3N). 1H NMR (300 MHz, CDCl3, δ, ppm): 9.89 (1H, br. s, -NH, Tyr), 9.72 (1H, br. s, -NH, Trp), 7.75 (1H, br. s, -NH, Phe), 7.47 (2H, br. s, -NH, indole ring and -OH, Tyr), 7.38-7.36 (1H, d, J = 7.75 Hz, α-H, indole ring), 7.25-7.23 (1H, d, J = 7.3 Hz, γ-H, indole ring), 7.21-7.15 (4H, m, m-H’s, Tyr and Phe), 7.14-7.05 (3H, m, δ-ζ-H’s, indole ring), 7.02-6.99 (1H, t, J = 6.15 Hz, p-H, Phe), 6.91 (1H, br. s, -NH, Gly), 6.88-6.84 (2H, dd, J = 8.55, 5.3 Hz, α-H’s, Tyr), 6.83-6.79 (2H, dd, J = 8.8, 4.15 Hz, α-H’s, Phe), 5.65-5.61 (1H, q, J = 5.6 Hz, α-H, Phe), 5.30-5.28 (2H, d, J = 4.75 Hz, CH2, Gly), 4.62-4.58 (1H, q, J = 6.2 Hz, α-H, Trp), 4.25-4.21 (1H, q, J = 7.85 Hz, α-H, Tyr), 3.92-3.89 (1H, t, J = 6.9 Hz, α-H, Pro-2), 3.87-3.84 (1H, t, J = 6.75 Hz, α-H, Pro-1), 3.26-3.23 (2H, t, δ-H’s, Pro-2), 3.21-3.18 (2H, t, δ-H’s, Pro-1), 2.89-2.87 (2H, d, J = 5.65 Hz, β-H’s, Trp), 2.72-2.63 (4H, m, β-H’s, Pro-1 and Pro-2), 2.59-2.57 (2H, d, J = 5.45 Hz, β-H’s, Tyr), 2.43-2.41 (2H, d, J = 5.85 Hz, β-H’s, Phe), 1.89-1.82 (4H, m, γ-H’s, Pro-1 and Pro-2). 13C NMR (CDCl3, 300 MHz): 173.5, 172.0 (C=O, α-C, indole ring), 170.2 (α-C, Tyr), 169.9, 169.3 (C=O, Tyr and Trp), 163.1, 162.3 (C=O, Gly and Phe), 154.4 (p-C, Tyr), 137.3 (γ-C, Phe), 135.9 (α-C’, indole ring), 132.2 (γ-C, Tyr), 129.8 (2C, α-C’s, Tyr), 128.9 (2C, α-C’s, Phe), 128.1 (2C, m-C’s, Tyr), 127.4 (2C, m-C’s, Phe), 127.0 (β-C’, indole ring), 126.1 (p-C, Phe), 123.3, 121.7 (α-C and ε-C, indole ring), 119.8, 118.5 (δ-C and γ-C, indole ring), 111.2, 109.6 (β-C and ζ-C, indole ring), 59.2 (α-C, Pro-2), 57.4 (α-C, Pro-1), 57.8 (α-C, Trp), 54.5 (α-C, Tyr), 53.0 (α-C, Phe), 49.7 (CH2, Gly), 48.0, 46.9 (δ-C’s, Pro-2 and Pro-1), 41.5 (β-C, Phe), 39.6 (β-C, Tyr), 30.3 (β-C, Pro-2), 27.8 (β-C, Pro-1), 27.0 (β-C, Trp), 25.2, 22.7 (2C, γ-C’s, Pro-1 and Pro-2). Biological activity

Antibacterial and antifungal activity studies

The synthesized cyclic hexapeptide was subjected to antibacterial and antifungal activity studies using Modified Kirby-Bauer’s method (16) against strains B. subtilis, S. aureus, P. aeruginosa, E. coli and M. audouinii, T. mentagrophytes, C. albicans and A. niger at 10 mcg/mL concentration. MIC values were determined in broth dilution method. Antimicrobial activity of the synthesized cyclic hexapeptide and their antibacterial and antifungal activities are found: C, 65.88; H, 6.05; N, 13.09%.

ues of test compound were determined by tube dilution technique using DMF and DMSO. A spore suspension in sterile distilled water was prepared from 5 days old culture of the test bacteria/fungi growing on nutrient broth media/Sabouraud’s broth media. About 20 mL of the growth medium was transferred into sterilized Petri plates and inoculated with 1.5 mL of the spore suspension (spore concentration – 6 × 10⁴ spores/mL). Filter paper disks of 6 mm diameter and 2 mm thickness were sterilized by autoclaving at 121°C for 15 min. Each Petri plate was divided into five equal portions along the diameter to place one disc. Three discs of test sample were placed on three portions together with one disc with reference drugs ciprofloxacin and griseofulvin and a disk impregnated with the solvent (DMF/DMSO) as negative control. Reference drugs were also tested at the same concentration of 10 mcg/mL. The Petri plates inoculated with bacterial/fungal cultures were incubated at 37°C for 18 h and 48 h, respectively. Diameters of the zones of inhibition (in mm) were measured and the average diameters for test sample were calculated of triplicate sets. The diameters obtained for the test sample were compared with that produced by the standard drug.

Antihelmintic activity studies

Antihelmintic activity studies were carried out using Garg’s method (17) against different species of earthworms like M. konkanensis, P. corethruses and Eudrilus sp. at 2 mg/mL concentration. Suspensions of samples were prepared by triturating synthesized compounds (100 mg) with Tween 80 (0.5%) and distilled water and the resulting mixtures were stirred using a mechanical stirrer for 30 min. The suspensions were diluted to contain 0.2% w/v of the test samples. Suspension of reference drugs, mebendazole and piperazine citrate were prepared with the same concentration in a similar way. Three sets of five earthworms of almost similar sizes (2 inch in length) were placed in Petri plates of 4 inch diameter containing 50 mL of suspension of test sample and reference drug at room temp. Another set of five earthworms was kept as control in 50 mL suspension of distilled water and Tween 80 (0.5%). The paralyzing and death times were noted and their mean was calculated for triplicate sets.

Detailed experimental procedures of antimicrobial and antihelmintic activity studies are given in our previously published reports (18, 19).

RESULTS

Chemistry

In the present investigation, first total synthesis of diandrine A was accomplished using disconnection strategy (20). The cyclic hexapeptide molecule was split into three dipeptide units Boc-Gly-Pro-OMe [I], Boc-Trp-Pro-OMe [II] and Boc-Tyr-Phe-OMe [III]. The required dipeptide units I-III were prepared by coupling of Boc-amino acids viz. Boc-Gly, Boc-Trp and Boc-Tyr with corresponding amino acid methyl ester hydrochlorides such as Pro-OMe.HCl and Phe-OMe.HCl employing diisopropylcarbodiimide (DIPC) as coupling agent. Ester group of dipeptide I was removed by alkaline hydrolysis with LiOH and amino group of dipeptide II was removed by using trifluoroacetic acid. Both the deprotected dipeptides were coupled together using DIPC as coupling agent and N-methylmorpholine (NMM) as base, to get the tetrapeptide unit Boc-Gly-Pro-Trp-Pro-OMe [IV]. Similarly, dipeptide III after deprotection at amino end, was coupled with tetrapeptide IV deprotected at carboxyl terminal, to get the linear hexapeptide unit Boc-Gly-Pro-Trp-Pro-Tyr-Phe-OMe [V]. The ester group of linear fragment was removed using LiOH and pentafluorophenyl (pfp) ester group was introduced. The Boc-group was removed using CF₃COOH and deprotected linear fragment was now cyclized by

keeping the whole contents at 0°C for 7 days in presence of catalytic amount of TEA/NMM/pyridine to get cyclic compound VI (Fig. 1). Structure of the newly synthesized cyclic hexapeptide as well as intermediates linear di/tetra/hexapeptides were confirmed by IR, 1H NMR, 13C NMR as well as elemental analysis. In addition, mass spectrum was recorded for the synthesized cyclohexapeptide.

**Pharmacology**

Synthesized cyclopeptide VI was screened for in vitro antimicrobial activity against Gram-positive bacteria *B. subtilis* and *S. aureus*, Gram-negative bacteria *P. aeruginosa* and *E. coli*, cutaneous fungi *M. audouinii* and *T. mentagrophytes*, diamorphic fungi *C. albicans* and *A. niger* and for antihelmintic activity against earthworms *M. konkanensis*, *P. corethruses* and *Eudrilus* sp. The results of pharmacological activity studies are tabulated in Tables 1 and 2.

**DISCUSSION AND CONCLUSION**

Synthesis of diandrine A was carried out successfully with good yield and NMM was proved to be a yield effective base for cyclization of linear hexapeptide fragment. Structure of synthesized peptide was confirmed by spectral as well as elemental analyses.

* Data are given as the mean ± S.D. (n = 3); = 2 mg/mL; = 0.5% Tween 80 in distilled water.

Six signals between δ 5.65-3.84 ppm in the proton spectrum of VI suggested a peptidic structure for the synthesized product, with these signals being attributable to the α-protons of all amino acid units. The 1H NMR spectrum of cyclized product showed presence of two broad singlets between δ 9.89-7.75, 6.91 ppm corresponding to the imino protons of the tyrosine, tryptophan, phenylalanine and glycine moieties, remaining amino acids being two proline units, indicating similarity of the structure of the newly synthesized cyclohexapeptide with the natural molecule. Moreover, 1H/13C NMR spectra of the cyclized product VI showed characteristic peaks confirming presence all the 45 protons and 41 carbon atoms. The presence of pseudomolecular ion peak at m/z 748.8 corresponding to the molecular formula C41H45N7O7 in mass spectra of VI, along with other fragment ion peaks resulting from cleavage at ‘Phe-Gly’, ‘Pro-Tyr’, ‘Pro-Trp’, ‘Gly-Pro’ and ‘Phe-Tyr’ amide bond levels, showed exact sequence of attachment of all the six amino acid units in a chain. In addition, elemental analysis data of VI afforded values (± 0.03) strictly in accordance to the molecular composition.

Synthesized cyclopeptide exhibited potent antihelmintic activity against *M. konkanensis*, *P. corethruses* and *Eudrilus sp.* at 2 mg/mL, in comparison to standard drugs – mebendazole and piperazine citrate. Moreover, compound VI showed better activity against dermatophytes *M. audouinii*, *T. mentagrophytes* and moderate level of activity against pathogenic microbes *P. aeruginosa*, *E. coli* and *C. albicans*. Gram-negative bacteria were found to be more sensitive towards compound VI in comparison to Gram-positive bacteria. On passing toxicity tests, synthesized cyclopeptide VI may prove good candidate for clinical studies and can be new antihelmintic and antidermatophyte drug of the future.
